

Language access in multilingual brains

- Influence of language environment
- Influence of other languages: L1 vs. L2/L3
- Influence of stereotypes

Speaker

Students of License Franco-Allemande living in Germany

- Language Environment: L2/L3
 - German (in day-to-day life)
- Target language: L3/L2
 - English (occasionally)
- L1: still in use (occasionally)
 - French (with friends and family)

Aim

Investigate the influence of visual stereotypes on language production access while the participants are presented with multimodal and multilingual stimuli to create a multilingual environment.

Prior work

Social priming influences speech perception

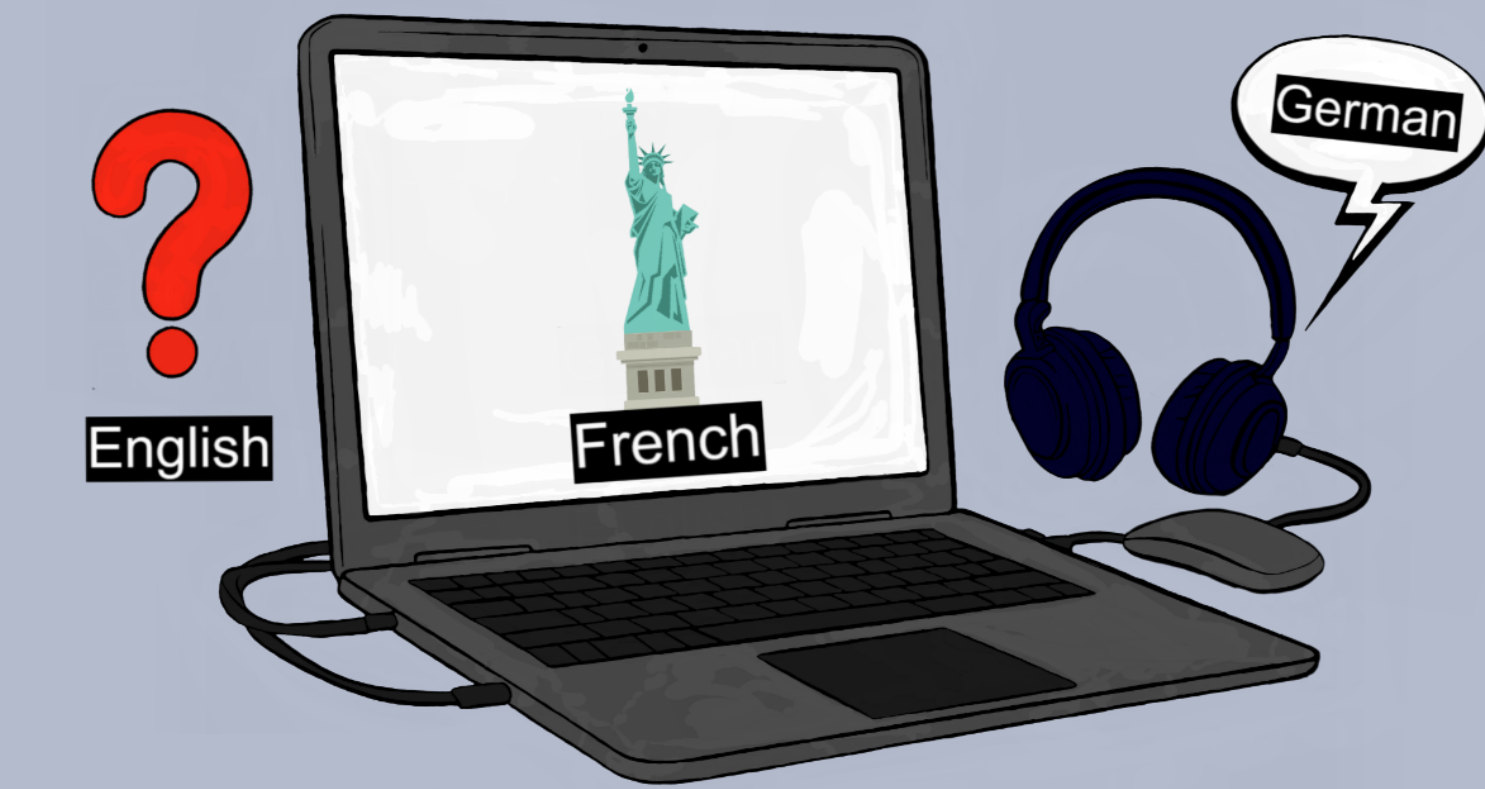

- Knowledge about speakers (e.g., age (Hay et al., 2006), gender (Strand, 1999, 2000), origin (Niedzielski, 1999))
- Stereotypical visual stimuli, e.g., stuffed animals (Hay & Drager, 2010)

Hypothesis: Social priming influences language production

Social stereotypes may increase likelihood of answering in a language matching the stereotype and possibly reduce speech initiation time

Condition 1

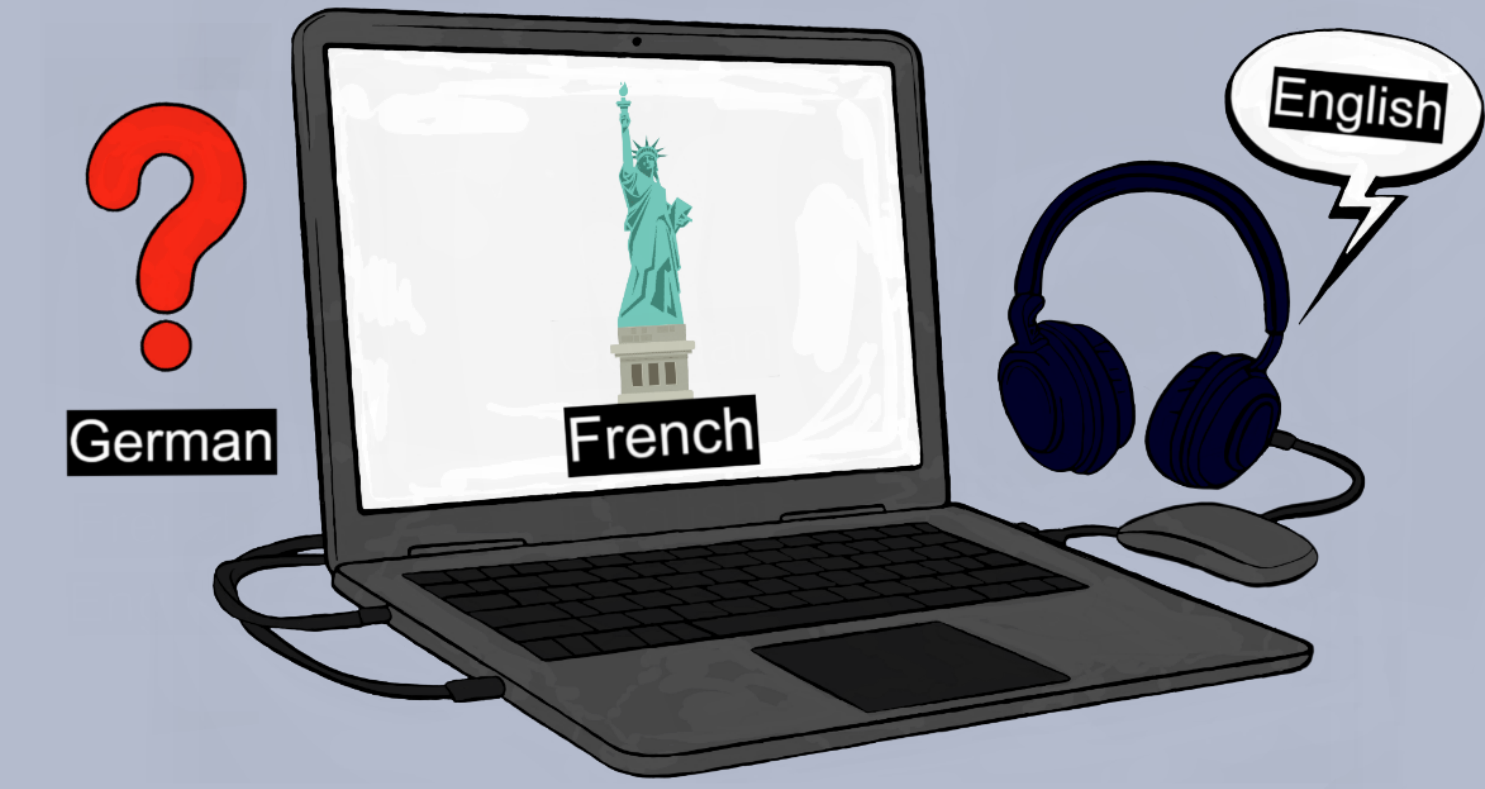

Condition 4

Stereotypes match Question

Subtitles: French
Audio: English/German
Stereotype: German/English
Question: German / English

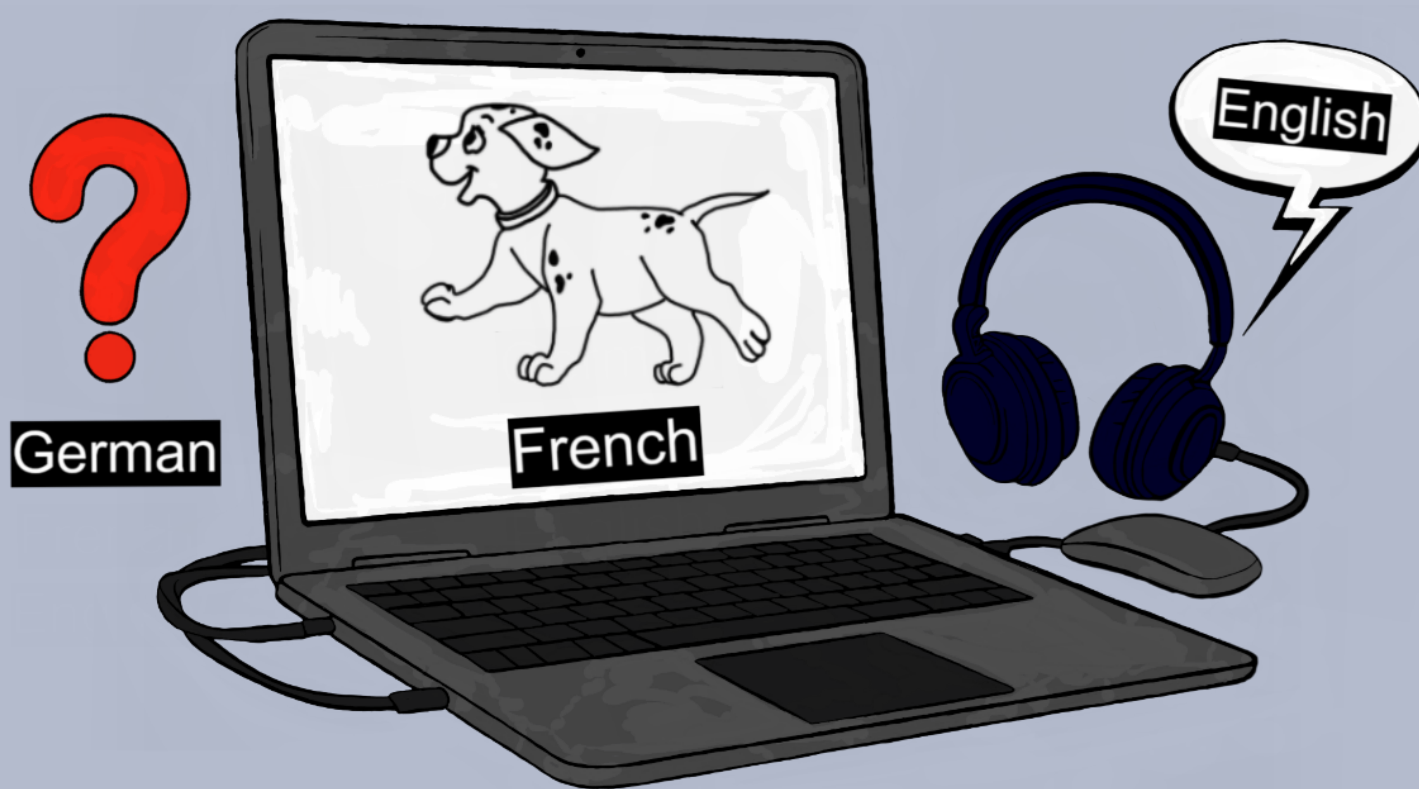

Condition 2

Condition 5

Stereotypes mismatch Question

Subtitles: French
Audio: German/English
Stereotype: German/English
Question: English/ German

Condition 3

Condition 6

No Stereotypes

Subtitles: French
Audio: English/German
Stereotype: None
Question: German/English
